

SMART Flow Elbow Continues to Impress Contractors

Grand Rapids, MI - February 18, 2011

Hart & Cooley Inc.'s latest energy saving product, the SMART Flow Elbow, is attracting a lot of attention. The patented SMART Flow Elbow is a durable elbow support that works by forming flexible duct bends into smooth, flowing, 90-degree elbows. It thereby reduces pressure drop in the duct by up to 500% when compared to kinked flexible duct, thus saving a significant amount of energy costs. The SMART Flow Elbow can be installed with all flexible ducts up to 16" diameter, in new and retrofit situations, and in both residential and commercial applications.

In today's economy, improving HVAC system efficiency is very important. Using a SMART Flow Elbow is a simple solution that just makes sense. Ms. Bonnie Stoltenburg, Purchasing Agent at Temperature

Systems, Madison, WI, states; "One of our contractors first noticed the new SMART Flow Elbows on our Tradeview Monitor while at our counter and purchased them for the new \$150 million medical campus in Janesville, Wisconsin that includes St. Mary's Janesville Hospital and a physician's office complex."

Fast installation is a major benefit of the SMART Flow Elbow. The contractor chose the SMART Flow Elbow for its ease of installation. According to Bonnie, "They figured saving at least \$3.00 on each during installation which almost paid for the 1,400 SMART Flow Elbows." It attaches to the outside of flexible duct with two cable ties quickly and easily. This simple design makes it ideal for installing it in both new and retrofit situations. It takes the guess work out of which size to use as one size fits all diameters of flex duct.

The SMART Flow Elbow is just one of the many products offered under Hart & Cooley Inc.'s SMART Air & Energy Solutions brand; dedicated to bringing quality and innovative IAQ (indoor air quality) and energy savings products to the HVAC industry.

You can see the SMART Flow Elbow at several upcoming shows, including the ACCA 2011 Indoor Air Expo in San Antonio, Texas on February 15-17, 2011, and the RESNET Conference in Orlando, Florida on February 2 - March 2, 2011. In fact, they're installed in the New American Home, an model energy efficient home featured at the International Builders Show, January 12-15, 2100 in Orlando, Florida.
